ROM cartridge, 32K

One EEPROM copied into one SRAM at power-up by the loader PLD (ROM.md, "Loading the cartridge")

U2 holds the 32K image, programmed off the board; its /WE is tied high. U3 is the ROM the CPU reads (15 ns). Both /CE are tied to GND: the 32K is seen in both halves (x0000 = x8000), and the loader copies it twice. /CE_HI (B16) is not used. The 64K cartridge is its own board (kicad/cartridge_64k).
U1 stalls the CPU at each PC address (STALL_OUT), pulses /SR_WE, lets the CPU step, and raises RUN when the PC wraps.
/CART (B10) is tied to GND: cartridge present.
Spare contacts are unassigned (EXPANSION.md).

Cartridge chips U1–U3 (docs/CHIPS.md, ROM cartridge); decoupling Cn goes with Un
